

tqec 2/11

Gilad: new paper on Arxiv regarding hook errors in TQEC — improve logical error rates via ancillary qubits

J: topologic can now operate on arbitrarily large circuits
Visualize linear object as entire circuit, not just individual gates

Austin: status update — what barriers do we have to completing patch rotation

Bella: bulk/fixed boundary convention — PR

Adrien: we need to find a better way
Optimizing relabeling of qubit targets has been done

Feel free to engage with PRs regardless of your degree of expertise, ask questions about it, run locally to check performance and correctness

Need to design code base around existing conventions, so that different distance patches don't collide

Reach out to Bella for assistance on her work, which is addressing a major pain point.

Ellipsoid shape — area of research.
